

TRIOTEIN™

180° Life System®

Triotein™ is a high-quality, lactose-free Whey Protein powder that provides the amino acid substrates needed to stimulate the body's production of intracellular glutathione peroxidase (GSH).

Studies have shown that GSH is the most powerful, naturally-occurring antioxidant and probably the most important molecule the body has for defense against toxins and the prevention of damage to cells.

The body is made of billions of cells – cells that have the ability to heal themselves when in the optimum health environment. Yet, every time you breathe, eat or drink, you could be exposing your body to environmental toxins that attack the body's cells.

These toxins – ultraviolet light, industrial waste, some building materials, cigarette smoke, auto exhaust, drugs, smog, pesticides, herbicides, and many more – can cause damage to the body's cells, having a negative effect on the body's natural defense.

Once toxins are neutralized or removed, normal cell function will often return to normal levels. Studies show that the best defense against toxins and the resulting free radicals are antioxidants, which neutralize destructive free radicals.

TRIOTEIN FAQs

Q. What is Glutathione (GSH) and why is it important?

A. GSH is a small tripeptide molecule composed of three amino acids – Glutamic Acid, Glycine, and Cysteine. All three amino acids must be present for the cell to produce GSH. Cysteine is the most difficult for humans to acquire and requires the presence of other amino acids to be effective.

Intracellular Glutathione levels appear to be an indicator of the cell's general health and ability to resist and defend against toxins, with the largest concentration of glutathione in the liver.

GSH is used by your body to continuously defend against free radical damage, infection, radiation damage,

damage from cellular toxification, and environmental exposure.

The two major protective functions of GSH are to provide antioxidant protection within the cell, especially in the nucleus where RNA and DNA must be protected, and to act as a protectant from toxic materials, especially in the liver and lungs.

Q. If GSH is a naturally-occurring antioxidant, why does the body need additional support for production.

A. Levels of GSH in cells can be diminished for a variety of reasons – stress, microbial attack, cellular

change, cellular degenerative change, traumatic change, exercise change, age, and lack of nutritional support. The GSH "pool" is not infinite and must be replenished or maintained to retain optimal health benefits.

Triotein™ Recommended Usage:

First Container: 3 scoops daily – 2 in the morning and one at night.
 2nd Container: 2 scoops daily – 2 in the morning.
 3rd Container: 1 scoop daily as maintenance.
 • See container for complete mixing instructions.

Caution:

- Do not mix with a mechanical blender or in a hot beverage as this is a sensitive product and you will destroy its bioactivity.
- Do not premix, the product has to be consumed within one hour of mixing.

Consult your health care professional prior to use if you have or suspect a medical condition, are taking prescription drugs, or are pregnant or lactating. No product testing is performed on animals.
